ö ö This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating thelicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptit ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis. GHPO protein, Helicobacter infection; gastroduodenal disease; gastritis; peptic ulcer disease. New isolated Helicobacter polynucleotides - used to develop products for the diagnosis, prevention and treatment of Helicobacter infections and gastrointestinal diseases Gaps Gaps .; 0 ö Query Match 77.3%; Score 34; DB 19; Length 380; Best Local Similarity 75.0%; Pred. [4] In Ingth CDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dr primer and an oligonucleotide expension of the complementary strand of a polynucleotide which complementary in the specification, where the complementary strand of a polynucleotide sequence conformation of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide which comprises a 5'-end sequence and an oligonucleotide comprision of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or alagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs and ANAS are present human annon acid sequences; AAB9346 to AAB936891 represent human annon acid sequences; AAB9346 to AAB936891 represent human annon acid sequences; and AAB13629 to AAB13620 complement of the complement of the exemplification considered on the assemblied of the complement 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer sets for synthesizing polynucleotides, particularly the 5602 (ull-length CDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length CDNAs .
                                                                                                                                                                                                                                                                                                                                             Human: primer; detection; diagnosis; antisense therapy; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isogai T, Nishikawa T, Hayashi K, Saito K, Yamamoto J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 9, Application US/08225477B;
Sequence 9, Application US/08225477B;
Patent No. 5635370
GENERAL INFORMATION:
APPLICANT: Susan HOckfield
TITLE OF INVENTION: BEHAB, A Brain Hya-
TITLE OF INVENTION: BEHAB, A Brain Hya-
TITLE OF INVENTION: Luronan-Binding Protein
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
ADDRESSEE: St. Onge Steward Johnston & Reens
STREET: 986 Bedford Street
CITX: Stanford
STATE: CT
COUNTRY: United States
ZIP: 06905

C; Species: Helicobacter pylori

A; Variety; strain J99

C; Date: 12-Feb-1999 #sequence_revision 12-Feb-1999 #text_change 16-Jul-1999

C; Accession: D/1973

Nature 397, 176-180, 1999

A; Title: Genomic sequence comparison of two unrelated isolates of the human gastric p

A; Reference number: A/1800; MUID: 99120557

A; Accession: D/1973

A; Status: preliminary

A; Status: preliminary

A; Status: creferences: GB:AE001449; GB:AE001439; NID:94154604; PIDN:AAD05677.1; PID:9415

C; Genetics:

A; Stene: metB

C; Superfamily: O-succinylhomoserine (thiol)-lyase
                                                                                                                                                                Cystathionine gamma-synthase - Helicobacter pylori (strain 26695)
C;Species: Helicobacter pylori

Chitin Synthase (EC 2.4.1.16) CSH1 - smut fungus (Ustilago maydis)
C;Species: Ustilago maydis (corn smut)
C;Accession: S5520
R;Xoconostle-Cazares, B.; Leon-Ramirez, C.; Ruiz-Herrera, J.
Submitted to the EmBL Data Library, June 1995
A;Description: Multiple chitin synthetase genes in Ustilago maydis. Cloning and chara A;Description: Multiple chitin synthetase genes in Ustilago maydis. Cloning and chara A;Setus: preliminary
A;Molecule type: DNA
A;Status: Preliminary
A;Molecule type: DNA
A;Cross-references: EMBL:X87748; NID:q861150; PID:q861151
C;Keywords: glycosyltransferase; hexosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Decorate the properties of the

                                                                          The present sequence is the antigenic epitope P597, derived from merozoite surface protein. (MSP-1) of the asexual blood stage of Plasmodium falciparum. It is used in the construction of recombinant protein CDC/MITMALWAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melitin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein. 2 (SSP-2), ilver stage antigen-1 (LSA-1), merozoite surface protein. 1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27 These epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/MITMALWAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/MITMALWAC-1 antibodies can be used for calculated and precenting P. falciparum in biological samples.
                                                                                                                                                                                                                                                                                                                         ô

Allelic variants of epidermal growth factor 1. or 2-like domains - of merozoite surface protein 1, produced recombinantly for malaria
                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                              The sequence is that of an allelic variant of a merozoite surface protein-1 epidetmal growth factor (EGF) 1 like domain. It may be used alone or as part of a fusion protein of EGF-1-like and EGF-2-like domains in vaccines against malaria. When expressed recombinantly it is produced in a form indistinguishable from that in the native protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequence is that of an allelic variant of a merozoite surface protein-1 epidermal growth factor (SGF) 1 like domain. It may be used alone or as part of a fusion protein of EGF-1-like and EGF-2-like domains in vaccines against malaria. When expressed recombinantly it is produced in a form indistinguishable from that in the native protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Epidermal growth factor 1; merozoite surface protein 1; malaria;

The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and MSP-1_1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is MSP-119 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "amino acids derived from P. falciparum MSP1 p19
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel variants of the C-terminal fragment of Plasmodium merozoite
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      surface protein-1, useful as vaccines for treating or preventing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Plasmodium vivax; merozoite surface protein; MSP1; p19; Plasmodium falciparum; malaria; vaccine; immunity; epitope.

This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum merozoite surface protein 1 (MSP1) 19 kD C-terminal fragment (P19), linked to a Glycosylephosophatidylinositol membrane anchoring sequence. P19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the P19 fragment provides a high level of protective immunity since it includes epitopes not presented in the P42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "encoded by restriction enzyme sequence used create the chimeric sequence"
                                                                                                                                                                                                                              Recombinant protein containing Plasmodium merozoite surface protein-1 p42 fragment - useful in antimalarial vaccines, also new antibodies for diagnosis and protein purification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        35..127 /note= "derived from P. falciparum C-terminal p19 fragment of MSP1"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric; Plasmodium vivax; merozoite surface protein; MSP1; p19; Plasmodium falciparum; malaria; vaccine; immunity; epitope.

                                                                                                                                                                                                                                                                                                                                                                                                                               This is the amino acid sequence of a recombinant protein comprising amino acids 1613-1705 of the Plasmodium falciparum meroxoite surface protein 1 (MSPI) 19 kD C-terminal fragment (p19), linked to a glycosylphosphatidylinositol membrane anchoring sequence. p19 is the C-terminal fragment of the 42 kD MSPI from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.

This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the Plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Aani613-Ser1705 which correspond to the 19 kD c-terminal fragment (p19) of MSP-1 from Plasmodium falciparum. p19 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; T-cell epitope; treatment; cast extensions (SPF: Sporzacite surface protein: 2.5SP-2; liver stage antigen-1; LSA-1; merozoite surface protein-1; MSP-1; apteal membrane antigen-1; ANA-1; erychrocyte binding antigen-175; seBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen: PEG-27; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;

                                                                                                                                                                                                                                                                                                    This is the amino acid sequence of a chimeric protein comprising amino acids 1-32 of the Plasmodium vivax merozoite surface protein 1 (MSP1) linked to amino acids Asni613-Ser1/05 which correspond to the 19 kD c-terminal fragment (pi9) of MSP-1 from Plasmodium falciparum. pl9 is the C-terminal fragment of the 42 kD MSP1 from Plasmodium species. The recombinant protein can be used for the production of anti-malarial vaccines, where the p19 fragment provides a high level of protective immunity since it includes epitopes not presented in the p42 fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ç

The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetranus toxoid and 21 antigenic epitopes from circumsporozoite from tetranus toxoid and 21 antigenic epitopes from circumsporozoite protein (GSP), sporozoite surface protein-2 (SSP-2), liver stage protein (LSA-1), merozoite surface protein (MSP-1), MSP-2, apical membrane antigen (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein (AMA-1) and gamete specific antigen, Pfg77. These epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALWAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Main-CDC/NIIMALWAC-1 antibodies can be used for detecting

The present sequence represents a 42 kDa C-terminal portion of malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an CC malaria merozoite surface protein MSP-1 (i.e. MSP-1-42), an CC malaria target for the development of a vaccine against comported to the development of a vaccine against plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 compared to the native sequence (see has been modified (see AAX56008) compared to the native sequence (see nower the AT content (from 76 to 49.7%) and to eliminate IO mRNA cospenite. These alterations allow MSP-1-42 to be expressed in sequence. These alterations allow MSP-1-42 to be expressed in mammalian cell culture and in transgenic mice. Native MSP-1-12 mammalian cell culture systems or in transgenic animals. The mammalian cell culture systems or in transgenic animals. The invention allows expression of MSP-1 protein in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New modified recombinant nucleic acid sequences useful for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This present sequence comprises a 42 kDa C-terminal portion of manaria merozotic surface protein MSP-1 (i.e. MSP-1-42), an impariant enerozotic surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against Plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. Nucleic acids (see AAX25586 and AAX25593) encoding MSP-1-42 have been modified according to a method of the invention in order to improve expression in mammallan cells and in transgenic animals. The invention provides modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that are difficult
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New modified recombinant nucleic acid sequences useful for producing malarial DNA vaccine
              This present sequence comprises a 42 kDa C-terminal portion of manaria merozotice surface protein MSP-1 (i.e. MSP-1.42), an important target for the development of a vaccine against Plasmodium falciparum. The C-terminal end of the sequence is modified to include a 6xHis tag. A nucleic acid (see AAX56008) encoding MSP-1.42 has been modified according to a method of the invention in order to improve expression in mammalian cells and in transgenic animals by reducing the AT content and removing mRNA instability motifs. The invention allows expression of MSP-1-42 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ga
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a 42 kDa C-terminal portion of malaria macrocite surface protein MSP-1 (i.e. MSP-1-42), an analaria macrocite surface protein MSP-1 (i.e. MSP-1-42), an important target for the development of a vaccine against plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 plasmodium falciparum. The nucleic acid sequence encoding MSP-1-42 compared to the native sequence (see AAX2588) compared to the native sequence (see AAX2587) such that 306 nucleocide positions have been replaced to lower the AT content (from 76 to 49.7%) and to eliminate 10 mRNA instability motifs while maintential manala and sequence. These alterations allow MSP-1-42 to be expressed in provides modified recombinant nucleic acid sequences and methods for increasing the mRNA levels and protein expression of proteins that contein candidates for expression are those derived from lower collure systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower conganisms such as parasites, bacteria and viruses that have DNA coding sequences of high AT content or which have mNA instability motifs or rare codons relative to the recombinant expression system coding sequences of high AT content or which have mNA instability motifs or rare codons relative to the recombinant expression in the milk of transgenic animals, and also provides a DNA vaccine the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a major merozoite surface protein-1 C-terminal fragment of 42kDa (MSP1-42). This fragment is linked to a malittin signal peptide, and then expressed in a in a silkworm/baculovirus system. The protein is used to prepare a malaria vaccine, which is used to treat or prevent malaria, caused by any of the four species of Plasmodium that infect humans.
                                                                                                                                                                                                                                                            Gaps
to express in cell culture systems, especially mammalian cell culture systems or in transgenic animals. The preferred difficult protein candidates for expression are those derived from lower organisms such as parasites, bacteria and viruses that have DNA conform sequences of high Ar content or which have mRNA instability motifs or rare codons relative to the recombinant expression system to be used. The invention allows expression of MSP-1 in the milk of transgenic animals, and also provides a DNA vaccine comprising a vector containing the altered MSP-1-42 nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Major merozoite surface protein-1; MSP1-42; melittin signal peptide; malaria vaccine.
